Job Description:

- The overall project is on developing experimental and computational tools to characterize heterogeneous catalysts undergoing solvent phase reactions.
- This position is for the computational sub-theme of the project. The candidate selected for this project is expected to use a combination of Density Functional Theory Simulations and Molecular Dynamics simulations (both ab initio MD and machine learned interatomic potentials-based MD) to understand the dynamics and evolution of catalytic active sites under different reaction environments.
- We are also interested in capturing the vibrational spectra of probe molecules interacting with these active sites. The computational insights and data will be integrated into a spectro-compute workflow for understanding and characterizing catalysts under liquid phase reaction conditions (operando characterization).
- A supported Pt-WO_x catalyst which has found diverse applications in reactions involving hydrogenation will be used as a model catalyst system to develop the tools and techniques.
- The scope typically includes, but is not limited to, critical review of the literature, setting up the different simulation workflows, data analysis, interfacing with the experimental counterparts in developing the integrated workflow, preparing reports and manuscripts for dissemination, making presentations about the work at national/ international conferences, and lab management.
- Expected experience: The candidate is expected to have proficiency in performing DFT and MD simulations and analysis.

The last date for submission of online application is 11.05.2026.
